GADTs aren't (even lax) functors

SMP 2023 – Boston

June 25th, 2023

-
1. First-order IAS for ADTs
 2. Higher-order IAS for ADTs
 3. IAS for GADTs?

1. First-order IAS for ADTs

ADTs

ADTs are families of inductive types:

ADTs

ADTs are families of inductive types:

```
data List ( $\alpha$  : Set) : Set where
  [] : List  $\alpha$ 
  _::_ :  $\alpha \rightarrow$  List  $\alpha \rightarrow$  List  $\alpha$ 
```

ADTs

ADTs are families of inductive types:

```
data List ( $\alpha$  : Set) : Set where
```

```
  [] : List  $\alpha$ 
```

```
  _::_ :  $\alpha$   $\rightarrow$  List  $\alpha$   $\rightarrow$  List  $\alpha$ 
```

```
data BinTree ( $\alpha$  : Set) : Set where
```

```
   $\emptyset$  : BinTree  $\alpha$ 
```

```
  _ $\otimes$ _ $\otimes$ _ : BinTree  $\alpha$   $\rightarrow$   $\alpha$   $\rightarrow$  BinTree  $\alpha$   $\rightarrow$  BinTree  $\alpha$ 
```

ADTs

ADTs are families of inductive types:

```
data List ( $\alpha$  : Set) : Set where
  [] : List  $\alpha$ 
  _::_ :  $\alpha \rightarrow$  List  $\alpha \rightarrow$  List  $\alpha$ 
```

```
data BinTree ( $\alpha$  : Set) : Set where
   $\emptyset$  : BinTree  $\alpha$ 
  _ $\otimes$ _ $\otimes$ _ : BinTree  $\alpha \rightarrow \alpha \rightarrow$  BinTree  $\alpha \rightarrow$  BinTree  $\alpha$ 
```

```
data N : Set where
  zero : N
  succ : N  $\rightarrow$  N
```

Categorical semantics of ADTs

```
data List ( $\alpha$  : Set) : Set where
  [] :  $\tau \rightarrow$  List  $\alpha$ 
  _::_ :  $\alpha \rightarrow$  List  $\alpha \rightarrow$  List  $\alpha$ 
```

Categorical semantics of ADTs

```
data List ( $\alpha$  : Set) : Set where
  [] :  $\tau \rightarrow$  List  $\alpha$ 
  _::_ :  $\alpha \rightarrow$  List  $\alpha \rightarrow$  List  $\alpha$ 
```

To interpret `List A`, take the initial algebra μL_A of:

$$L_A : \text{Set} \rightarrow \text{Set}$$
$$X \mapsto 1 + (A \times X)$$

where A interprets `A`

Categorical semantics of ADTs

ADTs are *uniform* families of inductive types:

```
data List ( $\alpha$  : Set) : Set where  
  [] :  $\tau \rightarrow$  List  $\alpha$   
  _::_ :  $\alpha \rightarrow$  List  $\alpha \rightarrow$  List  $\alpha$ 
```

Categorical semantics of ADTs

ADTs are *uniform* families of inductive types:

```
data List (α : Set) : Set where
  [] : τ → List α
  _::_ : α → List α → List α
```

$$\text{Set} \xrightarrow{L} [\text{Set}, \text{Set}]_{\omega} \xrightarrow{\mu} \text{Set}$$

$$A \longmapsto L_A \longmapsto \mu L_A$$

2. Higher-order IAS for ADTs

Categorical semantics of ADTs

ADTs can be seen as inductive families of types:

```
data List : Set → Set where  
  [] : ∀ {α} → τ → List α  
  _::_ : ∀ {α} → α → List α → List α
```

Categorical semantics of ADTs

ADTs can be seen as inductive families of types:

```
data List : Set → Set where
  [] : ∀ {α} → τ → List α
  _::_ : ∀ {α} → α → List α → List α
```

Rework the semantics: to interpret the type constructor `List`, take the initial algebra $\mu\mathcal{L}$ of

$$\begin{aligned}\mathcal{L} &: [\text{Set}, \text{Set}] \rightarrow [\text{Set}, \text{Set}] \\ F &\mapsto (X \mapsto 1 + (X \times F(X)))\end{aligned}$$

Categorical semantics of ADTs

ADTs can be seen as inductive families of types:

```
data List : Set → Set where
  [] : ∀ {α} → τ → List α
  _::_ : ∀ {α} → α → List α → List α
```

Rework the semantics: to interpret the type constructor `List`, take the initial algebra $\mu\mathcal{L}$ of

$$\begin{aligned}\mathcal{L} &: [\text{Set}, \text{Set}] \rightarrow [\text{Set}, \text{Set}] \\ F &\mapsto (X \mapsto 1 + (X \times F(X)))\end{aligned}$$

All is well

$$\mu\mathcal{L} \simeq \mu \circ L.$$

Categorical semantics of ADTs

$\mu\mathcal{L}$ can be computed as a colimit of an ω -chain:

$$0 \rightarrow \mathcal{L}(0) \rightarrow \dots \rightarrow \mathcal{L}^n(0) \rightarrow \dots$$

Categorical semantics of ADTs

$\mu\mathcal{L}$ can be computed as a colimit of an ω -chain:

$$0 \rightarrow \mathcal{L}(0) \rightarrow \dots \rightarrow \mathcal{L}^n(0) \rightarrow \dots$$

Consequence

When A is the set of closed terms of a given type A ,

$$\mu\mathcal{L}(A) \simeq \{\text{closed terms of type List } A\}$$

3. IAS for GADTs?

Generalized Algebraic Data Types

GADTs are inductive families of types, with a twist:

data Terms : Set → Set **where**

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

, : $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

Generalized Algebraic Data Types

GADTs are inductive families of types, with a twist:

data Terms : Set → Set where

nat : ℕ → Terms ℕ

, : ∀ {α β} → Terms α → Terms β → Terms (α × β)

π₁ : ∀ {α β} → Terms (α × β) → Terms α

π₂ : ∀ {α β} → Terms (α × β) → Terms β

data W : Set → Set where

∃ : ∀ {α} → α → W τ

Generalized Algebraic Data Types

GADTs are inductive families of types, with a twist:

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

, : $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

data W : Set \rightarrow Set where

\exists : $\forall \{\alpha\} \rightarrow \alpha \rightarrow$ W τ

data _ \equiv _ : Set \rightarrow Set \rightarrow Set where

r : $\forall \{\alpha\} \rightarrow \alpha \equiv \alpha$

Naive categorical semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{ \alpha \beta \} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{ \alpha \beta \} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{ \alpha \beta \} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

Naive categorical semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

, : $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

To interpret the type constructor Terms, take the initial algebra $\mu\mathcal{T}$ of:

$\mathcal{T} : [\text{Set}, \text{Set}] \rightarrow [\text{Set}, \text{Set}]$

$$F \mapsto \left(\begin{array}{c} X \mapsto \\ + \\ + \\ + \end{array} \right)$$

Naive categorical semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

, : $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

To interpret the type constructor Terms, take the initial algebra $\mu\mathcal{T}$ of:

$\mathcal{T} : [\text{Set}, \text{Set}] \rightarrow [\text{Set}, \text{Set}]$

$$F \mapsto \left(\begin{array}{l} X \mapsto \mathbb{N} \text{ if } X = \mathbb{N}, \emptyset \text{ otherwise} \\ + \\ + \\ + \end{array} \right)$$

Naive categorical semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

To interpret the type constructor Terms, take the initial algebra $\mu\mathcal{T}$ of:

$\mathcal{T} : [\text{Set}, \text{Set}] \rightarrow [\text{Set}, \text{Set}]$

$$F \mapsto \left(\begin{array}{l} X \mapsto \mathbb{N} \text{ if } X = \mathbb{N}, \emptyset \text{ otherwise} \\ + \\ \sum_{\substack{X_1, X_2 \\ X_1 \times X_2 = X}} F(X_1) \times F(X_2) \\ + \\ + \end{array} \right)$$

Naive categorical semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

To interpret the type constructor Terms, take the initial algebra $\mu\mathcal{T}$ of:

$\mathcal{T} : [\text{Set}, \text{Set}] \rightarrow [\text{Set}, \text{Set}]$

$$F \mapsto \left(\begin{array}{l} X \mapsto \mathbb{N} \text{ if } X = \mathbb{N}, \emptyset \text{ otherwise} \\ + \sum_{\substack{X_1, X_2 \\ X_1 \times X_2 = X}} F(X_1) \times F(X_2) \\ + \sum_{X_2} F(X \times X_2) \\ + \end{array} \right)$$

Naive categorical semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

To interpret the type constructor Terms, take the initial algebra $\mu\mathcal{T}$ of:

$\mathcal{T} : [\text{Set}, \text{Set}] \rightarrow [\text{Set}, \text{Set}]$

$$F \mapsto \left(\begin{array}{l} X \mapsto \mathbb{N} \text{ if } X = \mathbb{N}, \emptyset \text{ otherwise} \\ + \sum_{\substack{X_1, X_2 \\ X_1 \times X_2 = X}} F(X_1) \times F(X_2) \\ + \sum_{X_2} F(X \times X_2) \\ + \sum_{X_1} F(X_1 \times X) \end{array} \right)$$

Naive categorical semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

To interpret the type constructor Terms, take the initial algebra $\mu\mathcal{T}$ of:

$\mathcal{T} : [\text{Set}, \text{Set}] \rightarrow [\text{Set}, \text{Set}]$

$$F \mapsto \left(\begin{array}{l} X \mapsto \mathbb{N} \text{ if } X = \mathbb{N}, \emptyset \text{ otherwise} \\ + \sum_{\substack{X_1, X_2 \\ X_1 \times X_2 = X}} F(X_1) \times F(X_2) \\ + \sum_{X_2} F(X \times X_2) \quad ?? \\ + \sum_{X_1} F(X_1 \times X) \quad ?? \end{array} \right)$$

Naive categorical semantics of GADTs

data Terms : Set \rightarrow Set **where**

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-,_-$: $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

Actually, $\mu\mathcal{T} : \text{Set} \rightarrow \text{Set}$ being a **functor** is already an issue.

Naive categorical semantics of GADTs

data Terms : **Set** \rightarrow **Set** **where**

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

π_1 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms α

π_2 : $\forall \{\alpha \beta\} \rightarrow$ Terms $(\alpha \times \beta) \rightarrow$ Terms β

Actually, $\mu\mathcal{T} : \mathbf{Set} \rightarrow \mathbf{Set}$ being a **functor** is already an issue.

Consider the parity function $p : \mathbb{N} \rightarrow \mathbb{B}$, interpreted by $p : \mathbb{N} \rightarrow \mathbb{B}$. Because of $\mu\mathcal{T}(p) : \mu\mathcal{T}(\mathbb{N}) \rightarrow \mu\mathcal{T}(\mathbb{B})$, the interpretation of Terms \mathbb{B} contains weird elements...

Naive categorical semantics of GADTs

Even more striking with

```
data W : Set → Set where
```

```
  ∃ : ∀ {α} → α → W τ
```

Naive categorical semantics of GADTs

Even more striking with

```
data W : Set → Set where
```

```
  ∃ : ∀ {α} → α → W τ
```

If W is interpreted as the initial algebra $\mu\mathcal{W} : \mathbf{Set} \rightarrow \mathbf{Set}$ of a certain \mathcal{W} :

Naive categorical semantics of GADTs

Even more striking with

data $W : \mathbf{Set} \rightarrow \mathbf{Set}$ **where**

$\exists : \forall \{\alpha\} \rightarrow \alpha \rightarrow W \tau$

If W is interpreted as the initial algebra $\mu\mathcal{W} : \mathbf{Set} \rightarrow \mathbf{Set}$ of a certain \mathcal{W} :

- for each $X \in \mathbf{Set}$,

$$\exists_X : X \rightarrow \mu\mathcal{W}(1),$$

Naive categorical semantics of GADTs

Even more striking with

data $W : \mathbf{Set} \rightarrow \mathbf{Set}$ **where**

$\exists : \forall \{ \alpha \} \rightarrow \alpha \rightarrow W \tau$

If W is interpreted as the initial algebra $\mu\mathcal{W} : \mathbf{Set} \rightarrow \mathbf{Set}$ of a certain \mathcal{W} :

- for each $X \in \mathbf{Set}$,

$$\exists_X : X \rightarrow \mu\mathcal{W}(1),$$

- for each $x : 1 \rightarrow X$,

$$\mu\mathcal{W}(X) \ni \mu\mathcal{W}(x)(\exists_1(*))$$

Naive categorical semantics of GADTs

Even more striking with

data $W : \mathbf{Set} \rightarrow \mathbf{Set}$ **where**

$\exists : \forall \{ \alpha \} \rightarrow \alpha \rightarrow W \tau$

If W is interpreted as the initial algebra $\mu\mathcal{W} : \mathbf{Set} \rightarrow \mathbf{Set}$ of a certain \mathcal{W} :

- for each $X \in \mathbf{Set}$,

$$\exists_X : X \rightarrow \mu\mathcal{W}(1),$$

- for each $x : 1 \rightarrow X$,

$$\mu\mathcal{W}(X) \ni \mu\mathcal{W}(x)(\exists_1(*))$$

That is, $\mu\mathcal{W}(X) \neq \emptyset$ whenever $X \neq \emptyset$...

Naive categorical semantics of GADTs

$$1 \xrightarrow{\exists_1} \mu\mathcal{W}(1) \xrightarrow{\mu\mathcal{W}(x)} \mu\mathcal{W}(X)$$

Naive categorical semantics of GADTs

$$1 \xrightarrow{\exists_1} \mu\mathcal{W}(1) \xrightarrow{\mu\mathcal{W}(x)} \mu\mathcal{W}(X)$$

Issue

$\mu\mathcal{W}(x)$ has to make a new element in $\mu\mathcal{W}(X)$ from $\exists_1(*) \in \mu\mathcal{W}(1)$.

Naive categorical semantics of GADTs

$$1 \xrightarrow{\exists_1} \mu\mathcal{W}(1) \xrightarrow{\mu\mathcal{W}(x)} \mu\mathcal{W}(X)$$

Issue

$\mu\mathcal{W}(x)$ has to make a new element in $\mu\mathcal{W}(X)$ from $\exists_1(*) \in \mu\mathcal{W}(1)$.

Potential solution

Allowing $\mu\mathcal{W}(x)$ to be a **partial function**.

Less naive categorical semantics of GADTs

PSet: category of sets and **partial function** between them. So $\text{Set} \hookrightarrow \text{PSet}$.

Less naive categorical semantics of GADTs

PSet: category of sets and **partial function** between them. So $\mathbf{Set} \hookrightarrow \mathbf{PSet}$.

Fact

For any composable functions f, g in \mathbf{PSet} , if gf is total, then so is f .

Less naive categorical semantics of GADTs

PSet: category of sets and **partial function** between them. So $\mathbf{Set} \hookrightarrow \mathbf{PSet}$.

Fact

For any composable functions f, g in \mathbf{PSet} , if gf is total, then so is f .

Idea

Interpret the total functions of the language in \mathbf{Set} and “spill” in \mathbf{PSet} for partial functions.

Less naive categorical semantics of GADTs

But...

Less naive categorical semantics of GADTs

But...

```
data _≡_ : Set → Set → Set where  
  r : ∀ {α} → α ≡ α
```

Less naive categorical semantics of GADTs

But...

```
data _≡_ : Set → Set → Set where
  r : ∀ {α} → α ≡ α
```

- `_≡_` interpreted as: a set $(X \equiv Y)$ for every sets X, Y

Less naive categorical semantics of GADTs

But...

```
data _≡_ : Set → Set → Set where
  r : ∀ {α} → α ≡ α
```

- `_≡_` interpreted as: a set $(X \equiv Y)$ for every sets X, Y
- `r` interpreted as: a total function $r_X : 1 \rightarrow (X \equiv X)$ for every set X

Less naive categorical semantics of GADTs

But...

```
data _≡_ : Set → Set → Set where
  r : ∀ {α} → α ≡ α
```

- `_≡_` interpreted as: a set $(X \equiv Y)$ for every sets X, Y
- `r` interpreted as: a total function $r_X : 1 \rightarrow (X \equiv X)$ for every set X

If `— ≡ —` extends to a functor $\mathbf{PSet}^2 \rightarrow \mathbf{PSet}$: for any $x : 1 \rightarrow X$,

Less naive categorical semantics of GADTs

But...

```
data _≡_ : Set → Set → Set where
```

```
  r : ∀ {α} → α ≡ α
```

- `_≡_` interpreted as: a set $(X \equiv Y)$ for every sets X, Y
- `r` interpreted as: a total function $r_X : 1 \rightarrow (X \equiv X)$ for every set X

If `_≡_` extends to a functor $\mathbf{PSet}^2 \rightarrow \mathbf{PSet}$: for any $x : 1 \rightarrow X$,

$$p_x : 1 \xrightarrow{r_1} 1 \equiv 1 \xrightarrow{(x \equiv \text{id}_1)} (X \equiv 1)$$

Less naive categorical semantics of GADTs

$\text{trp} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \alpha \rightarrow \beta$

$\text{trp } \alpha \ \alpha \ r \ x = x$

$\text{trp}^{-1} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \beta \rightarrow \alpha$

$\text{trp } \beta \ \beta \ r \ y = y$

Less naive categorical semantics of GADTs

$\text{trp} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \alpha \rightarrow \beta$

$\text{trp } \alpha \alpha \ r \ x = x$

$\text{trp}^{-1} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \beta \rightarrow \alpha$

$\text{trp } \beta \beta \ r \ y = y$

- trp interpreted as: a total function $t_{X,Y} : (X \equiv Y) \times X \rightarrow Y$ for all sets X, Y

Less naive categorical semantics of GADTs

$\text{trp} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \alpha \rightarrow \beta$

$\text{trp } \alpha \alpha \ r \ x = x$

$\text{trp}^{-1} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \beta \rightarrow \alpha$

$\text{trp } \beta \beta \ r \ y = y$

- trp interpreted as: a total function $t_{X,Y} : (X \equiv Y) \times X \rightarrow Y$ for all sets X, Y
- trp^{-1} interpreted as: a total function $t_{X,Y}^{-1} : (X \equiv Y) \times Y \rightarrow X$ for all sets X, Y

Less naive categorical semantics of GADTs

$\text{trp} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \alpha \rightarrow \beta$

$\text{trp } \alpha \alpha \ r \ x = x$

$\text{trp}^{-1} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \beta \rightarrow \alpha$

$\text{trp } \beta \beta \ r \ y = y$

- trp interpreted as: a **total** function $t_{X,Y} : (X \equiv Y) \times X \rightarrow Y$ for all sets X, Y
- trp^{-1} interpreted as: a **total** function $t_{X,Y}^{-1} : (X \equiv Y) \times Y \rightarrow X$ for all sets X, Y

Less naive categorical semantics of GADTs

$\text{trp} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \alpha \rightarrow \beta$

$\text{trp } \alpha \alpha \ r \ x = x$

$\text{trp}^{-1} : \forall \{\alpha \beta\} \rightarrow \alpha \equiv \beta \rightarrow \beta \rightarrow \alpha$

$\text{trp } \beta \beta \ r \ y = y$

- trp interpreted as: a **total** function $t_{X,Y} : (X \equiv Y) \times X \rightarrow Y$ for all sets X, Y
- trp^{-1} interpreted as: a **total** function $t_{X,Y}^{-1} : (X \equiv Y) \times Y \rightarrow X$ for all sets X, Y
- $(\lambda p \ x \rightarrow \text{trp}^{-1} \ p \ (\text{trp} \ p \ x))$ reduces to $(\lambda p \ x \rightarrow x)$:

$$\begin{array}{ccc} (X \equiv Y) \times X & \xrightarrow{\langle \pi_1, t_{X,Y} \rangle} & (X \equiv Y) \times Y \\ & \searrow \pi_2 & \downarrow t_{X,Y}^{-1} \\ & & X \end{array}$$

Less naive categorical semantics of GADTs

$$\begin{array}{ccc} (X \equiv Y) \times X & \xrightarrow{\langle \pi_1, t_{X,Y} \rangle} & (X \equiv Y) \times Y \\ & \searrow \pi_2 & \downarrow t_{X,Y}^{-1} \\ & & X \end{array}$$

Less naive categorical semantics of GADTs

$$\begin{array}{ccc} (X \equiv 1) \times X & \xrightarrow{\langle \pi_1, t_{X,1} \rangle} & (X \equiv 1) \times 1 \\ & \searrow \pi_2 & \downarrow t_{X,1}^{-1} \\ & & X \end{array}$$

Less naive categorical semantics of GADTs

$$\begin{array}{ccccc} X & \xrightarrow{\langle p_x \circ !, \text{id}_X \rangle} & (X \equiv 1) \times X & \xrightarrow{\langle \pi_1, t_{X,1} \rangle} & (X \equiv 1) \times 1 \\ & & & \searrow \pi_2 & \downarrow t_{X,1}^{-1} \\ & & & & X \end{array}$$

Less naive categorical semantics of GADTs

$$\begin{array}{ccccc} X & \xrightarrow{\langle p_x \circ !, \text{id}_X \rangle} & (X \equiv 1) \times X & \xrightarrow{\langle \pi_1, t_{X,1} \rangle} & (X \equiv 1) \times 1 \\ & \searrow \text{id}_X & & & \downarrow t_{X,1}^{-1} \\ & & & & X \end{array}$$

Less naive categorical semantics of GADTs

$$\begin{array}{ccccc} & & & & 1 \\ & & & \searrow & \downarrow \langle p_x, \text{id}_1 \rangle \\ X & \xrightarrow{\langle p_x \circ !, \text{id}_X \rangle} & (X \equiv 1) \times X & \xrightarrow{\langle \pi_1, t_{X,1} \rangle} & (X \equiv 1) \times 1 \\ & \searrow \text{id}_X & & & \downarrow t_{X,1}^{-1} \\ & & & & X \end{array}$$

The diagram illustrates a commutative square in a categorical semantics of GADTs. The objects are X , $(X \equiv 1) \times X$, $(X \equiv 1) \times 1$, and X . The top-left corner is X , the top-right is 1 , the bottom-left is $(X \equiv 1) \times X$, and the bottom-right is X . The horizontal arrows are $\langle p_x \circ !, \text{id}_X \rangle$ and $\langle \pi_1, t_{X,1} \rangle$. The vertical arrows are $\langle p_x, \text{id}_1 \rangle$ and $t_{X,1}^{-1}$. A diagonal arrow labeled id_X goes from X to X . A curved arrow labeled $!$ goes from X to 1 .

Less naive categorical semantics of GADTs

$$\begin{array}{ccccc} & & & & 1 \\ & & & \searrow & \downarrow \langle p_x, \text{id}_1 \rangle \\ & & & & (X \equiv 1) \times 1 \\ X & \xrightarrow{\langle p_x \circ !, \text{id}_X \rangle} & (X \equiv 1) \times X & \xrightarrow{\langle \pi_1, t_{X,1} \rangle} & \\ & \searrow \text{id}_X & & & \downarrow t_{X,1}^{-1} \\ & & & & X \end{array}$$

$\implies X$ is a retract of 1

Less naive categorical semantics of GADTs

$\implies X \simeq 1$ whenever $t_{X,1}^{-1} \langle p_x, \text{id}_1 \rangle$ is total

Less naive categorical semantics of GADTs

$\implies X \simeq 1$ whenever p_x is total

Less naive categorical semantics of GADTs

$$\begin{array}{ccccc} & & & & 1 \\ & & & & \downarrow \langle p_x, \text{id}_1 \rangle \\ & & & & (X \equiv 1) \times 1 \\ X & \xrightarrow{\langle p_x \circ !, \text{id}_X \rangle} & (X \equiv 1) \times X & \xrightarrow{\langle \pi_1, t_{X,1} \rangle} & \\ & \searrow \text{id}_X & & & \downarrow t_{X,1}^{-1} \\ & & & & X \end{array}$$

The diagram shows a commutative square with an additional arrow. The top-left node is X . The top-right node is 1 . The bottom-left node is $(X \equiv 1) \times X$. The bottom-right node is $(X \equiv 1) \times 1$. The bottom-most node is X . Arrows are: $X \rightarrow (X \equiv 1) \times X$ labeled $\langle p_x \circ !, \text{id}_X \rangle$; $(X \equiv 1) \times X \rightarrow (X \equiv 1) \times 1$ labeled $\langle \pi_1, t_{X,1} \rangle$; $(X \equiv 1) \times 1 \rightarrow X$ labeled $t_{X,1}^{-1}$; $X \rightarrow X$ labeled id_X ; and $1 \rightarrow (X \equiv 1) \times 1$ labeled $\langle p_x, \text{id}_1 \rangle$. A curved arrow labeled $!$ goes from X to 1 .

$\implies X \simeq 1$ whenever x is total

Less naive categorical semantics of GADTs

$\Rightarrow X \simeq 1$ whenever $X \neq \emptyset$

Less naive categorical semantics of GADTs

Theorem

If GADTs' interpretations extend to functors, the interpretation of any non-empty closed type is trivial.

Less naive categorical semantics of GADTs

Theorem

If GADTs' interpretations extend to functors, the interpretation of any non-empty closed type is trivial.

Issue

Functors send sections to sections, but GADTs send sections to partial injections.

Lax-functorial semantics of GADTs

In **PSet**: $f \leq g$ if and only if $\mathbf{Dom} f \subseteq \mathbf{Dom} g$ is more defined than f and $g \upharpoonright_{\mathbf{Dom} f} = f$.

Lax-functorial semantics of GADTs

In **PSet**: $f \leq g$ if and only if $\mathbf{Dom} f \subseteq \mathbf{Dom} g$ is more defined than f and $g \upharpoonright_{\mathbf{Dom} f} = f$.

Definition

A **normal lax functor** $G : \mathbf{PSet} \rightarrow \mathbf{PSet}$ is just like a functor except:

- G respects \leq ,
- $G(gf) \leq G(g)G(f)$ instead of $G(gf) = G(g)G(f)$.

Lax-functorial semantics of GADTs

```
data Terms : Set → Set where
  nat : ℕ → Terms ℕ
  _,_ : ∀ {α β} → Terms α → Terms β → Terms (α × β)
  ...
```

But...

Lax-functorial semantics of GADTs

```
data Terms : Set → Set where
  nat : ℕ → Terms
  _,_  : ∀ {α β} → Terms α → Terms β → Terms (α × β)
  ...
```

But...

Consider $f, g : \mathbb{N} \times \mathbb{N} \rightarrow \mathbb{N} \times \mathbb{N}$ with:

$$\begin{aligned} f(0, y) &= (0, y), & f(x > 0, y) &\text{undefined} \\ g(x, y) &= (x, x + y) \end{aligned}$$

If $T : \mathbf{PSet} \rightarrow \mathbf{PSet}$ normal lax interprets `Terms`, then $T(f) \leq T(g)$.

Lax-functorial semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{ \alpha \beta \} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

...

- $n : \mathbb{N} \rightarrow T(\mathbb{N})$ interprets nat
- $\langle -, - \rangle_{X,Y} : T(X) \times T(Y) \rightarrow T(X \times Y)$ interprets $-, -$ at X, Y

Lax-functorial semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{ \alpha \ \beta \} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

...

- $n : \mathbb{N} \rightarrow T(\mathbb{N})$ interprets nat
- $\langle -, - \rangle_{X,Y} : T(X) \times T(Y) \rightarrow T(X \times Y)$ interprets $-, -$ at X, Y

- $T(f)(\langle n(0), n(y) \rangle) = \langle n(0), n(y) \rangle$

Lax-functorial semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

...

- $n : \mathbb{N} \rightarrow T(\mathbb{N})$ interprets nat
- $\langle -, - \rangle_{X,Y} : T(X) \times T(Y) \rightarrow T(X \times Y)$ interprets $-, -$ at X, Y

- $T(f)(\langle n(0), n(y) \rangle) = \langle n(0), n(y) \rangle$
- $T(f) \leq T(g)$ so $T(g)$ also defined on $\langle n(0), n(y) \rangle$

Lax-functorial semantics of GADTs

data Terms : Set \rightarrow Set where

nat : $\mathbb{N} \rightarrow$ Terms \mathbb{N}

$-, -$: $\forall \{\alpha \beta\} \rightarrow$ Terms $\alpha \rightarrow$ Terms $\beta \rightarrow$ Terms $(\alpha \times \beta)$

...

- $n : \mathbb{N} \rightarrow T(\mathbb{N})$ interprets nat
- $\langle -, - \rangle_{X,Y} : T(X) \times T(Y) \rightarrow T(X \times Y)$ interprets $-, -$ at X, Y

- $T(f)(\langle n(0), n(y) \rangle) = \langle n(0), n(y) \rangle$
- $T(f) \leq T(g)$ so $T(g)$ also defined on $\langle n(0), n(y) \rangle$
- $T(g)(\langle n(0), n(y) \rangle) = T(f)(\langle n(0), n(y) \rangle) = \langle n(0), n(y) \rangle \dots$

Thank you.
